Subject: Re: Data as requested

I am part of a group in an Environmental class at Dalhousie University. We are examining Suburban Development of Lakes. We are doing a comparison of Settle and Bell lakes in Dartmouth, and proposed development around Hail Pond in Armdale, Halifax. I am not sure they are comparable, what with the presence of Phos in Feldspars in the Granites skewing the P in the lakes in Nova Scotia. I suspect Granite-Based lakes in Nova Scotia are more limited in Nitrogen than Phosporus. I doubt we will delve into that matter though ... My group is more interested in the philosophy of development than the science.

I will forward you a copy of the paper, when completed.

Thanks again,  
--Shane
